VEGETABLES - FRESH MARKET

ANNUAL SUMMARY

1970

The estimated production of the 22 principal fresh market vegetables and melons for 1970 is 1 percent more than in 1969, according to the Crop Reporting Board. The 1970 production of 223.9 million hundredweight compares with 1969 production of 221.9 million hundredweight and the 1968 production of 221.8 million. For the major crops, the increases over 1969 for cabbage, sweet corn, lettuce and onions more than offset smaller production of carrots, celery and tomatoes. The 22 principal vegetable and melon crops had a total value of \$1,207 million, 3 percent less than a year earlier. Leading crops in value were lettuce and tomatoes whose combined total accounted for 36 percent of the U. S. total.

The 1970 strawberry crop of 4.9 million hundredweight is 2 percent more than last year but 5 percent below 1968. Production for fresh market accounted for 64 percent of the 1970 strawberry crop and processing 36 percent. Also included in this report are estimates for production of mint for oil, which was valued at more than \$26 million in 1970.

The five leading States in the 1970 production of fresh vegetables and melons were California, Florida, Texas, Arizona and New York. These States accounted for 67 percent of the harvested acreage, 73 percent of the production, and 77 percent of the value of the vegetables and melons produced in the United States.

LEADING FRESH MARKET VEGETABLE STATES IN 1970

Rank	Harvested Acreage		Production		Value	
	State	Percent of total	State	Percent of total	State	Percent of total
1	California	28.8	California	39.3	California	42.2
2	Florida	15.7	Florida	12.6	Florida	16.3
3	Texas	14.1	Texas	10.1	Texas	9.2
4	Arizona	4.7	Arizona	5.7	Arizona	5.4
5	New York	4.0	New York	5.3	New York	3.8

Estimates in this publication relate primarily to fresh market production. Production is defined as the amount sold or utilized for all vegetables except late summer onions and Upstate New York early fall cabbage, for which production is defined as the quantity hauled from the field. Quantities not sold because of economic reasons are excluded from production estimates but are reported in the footnotes. While estimates for many vegetable crops include only fresh market production, those for a few crops, such as broccoli, cauliflower, and carrots, include substantial quantities processed. For asparagus and strawberries, which are perennial crops providing production for both fresh market and processing outlets from the same acreage, a utilization breakdown is given in addition to total production.

Seasonal groups and crop totals for 1968 exclude States for which estimates were discontinued in 1969.

In this publication, the volume of vegetables sold for fresh market use is valued at f.o.b. shipping point, except garlic, for which prices are reported annually on a field run basis at the packinghouse door. The volume sold for processing is valued at the processing plant door-- i.e., "equivalent returns at packinghouse door." For vegetables sold both for fresh consumption and for processing, total value is the sum of the values for both types of utilization. Per

unit value is the quotient derived by dividing total value by total quantity. "Per unit value" is not in general a "price." It is not generally used for parity purposes except where one or the other types of utilization is negligible.

Harvested acreage is defined as the land area from which the crop was harvested, either partially or completely. Planted acreage includes, in addition to acreage harvested, acreage lost or abandoned due to natural or economic causes. Acreage lost and replanted to the same crop for harvest in the same season is counted only once. Acreage lost and replanted to the same crop for harvest in a later season is considered to have been planted in both seasonal classifications, but is included as acreage for harvest in the second season only. Acreage lost and replanted to another vegetable crop is included as planted acreage in estimates for both crops, but as acreage harvested for the second crop only. Both planted and harvested acreage published for asparagus and strawberries, include only bearing acreage and exclude non-bearing acreage planted for harvest in future marketing seasons. Value is for the crop year and does not correspond to calendar year income.

This summary provides fresh market estimates for the 22 principal vegetables and melons grown commercially in the more important producing States. These estimates provide basic statistics for over 80 percent of the national output of all vegetables and melons grown for fresh market sale.

These data are based upon information secured from growers, shippers, processors, public agencies, and other sources.
